In this flow, whenever you return HTML you use a `PageResult`; when you redirect to a new page, you use a `RedirectToPageResult`.

TIP Razor Pages are generally designed to be stateless, so if you want to persist data between multiple pages, you need to place it in a database or similar store. If you want to store data for a single request, you may be able to use `TempData`, which stores small amounts of data in cookies for a single request. See the documentation for details: http://mng.bz/XdXp.

15.4.2 NotFoundResult and StatusCodeResult

As well as sending HTML and redirect responses, you'll occasionally need to send specific HTTP status codes. If you request a page for viewing a product on an e-commerce application, and that product doesn't exist, a `404` HTTP status code is returned to the browser, and you'll typically see a "Not found" web page. Razor Pages can achieve this behavior by returning a `NotFoundResult`, which returns a raw `404` HTTP status code. You could achieve a similar result using `StatusCodeResult` and setting the status code returned explicitly to `404`.

Note that `NotFoundResult` doesn't generate any HTML; it only generates a raw `404` status code and returns it through the middleware pipeline. This generally isn't a great user experience, as the browser typically displays a default page, such as that shown in figure 15.4.
