

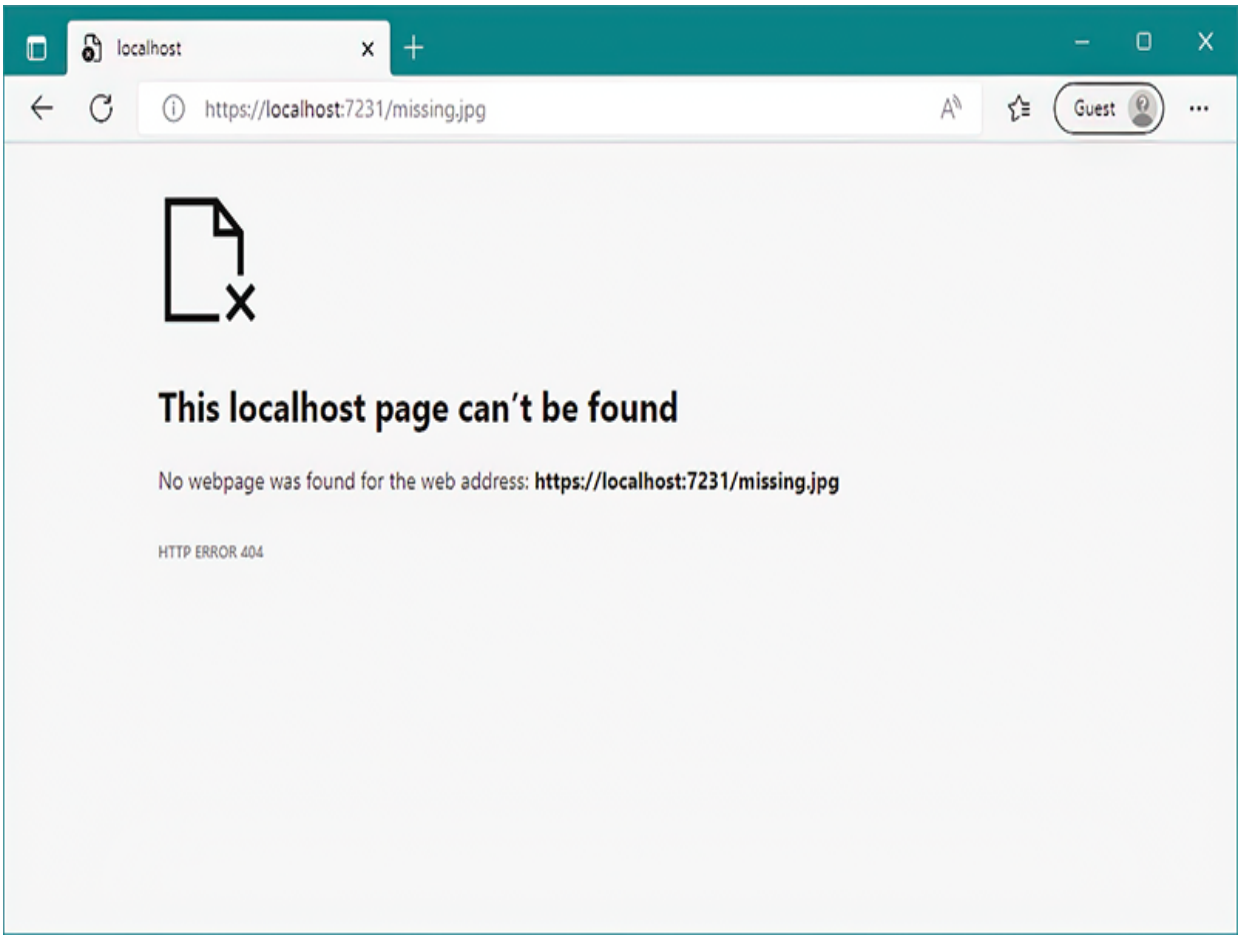

Figure 15.4 If you return a raw `404` status code without any HTML, the browser will render a generic default page instead. The message is of limited utility to users and may leave many of them confused or thinking that your web application is broken.

Returning raw status codes is fine when you're building an API, but for a Razor Pages application, this is rarely good enough. In section 15.5 you'll learn how you can intercept this raw `404` status code after it's been generated and provide a user-friendly HTML response for it instead.
