The approach I choose tends to depend on the specific Razor Page I'm building. If I'm creating a form, I will favor the `[BindProperty]` approach, as I typically need access to the request values inside the Razor view. For simple pages, where the binding model is a product ID, for example, I tend to favor the page handler parameter approach for its simplicity, especially if the handler is for a `GET` request. I give some more specific advice on my approach in section 16.4.

Figure 16.4 shows an example of a request creating the `ProductModel` method argument using model binding for the example shown at the start of this section:

```
public void OnPost(ProductModel product)
```
