Figure 16.7 When validation fails, you can redisplay the form to display `ModelState` validation errors to the user. Note that the Your Name field has no associated validation errors, unlike the other fields.

NOTE The error messages displayed on the form are the default values for each validation attribute. You can customize the message by setting the `Error-Message` property on any of the validation attributes. For example, you could customize a `[Required]` attribute using `[Required(ErrorMessage="Required")].`

If the request is successful, the page handler returns a `RedirectToPageResult` (using the `RedirectToPage()` helper method) that redirects the user to the Success.cshtml Razor Page. This pattern of returning a redirect response after a successful `POST` is called the POST-REDIRECT-GET pattern.

POST-REDIRECT-GET

The POST-REDIRECT-GET design pattern is a web development pattern that prevents users from accidentally submitting the same form multiple times. Users typically submit a form using the standard browser `POST` mechanism, sending data to the server. This is the normal way by which you might take a payment, for example.

If a server takes the naive approach and responds with a `200 OK` response and some HTML to display, the user will still be on the same URL. If the user refreshes their browser, they will be making an *additional* `POST` to the server, potentially making *another* payment! Browsers have some mechanisms to prevent this, such as in the following figure, but the user experience isn't desirable.
