

Refreshing a browser window after a `POST` causes a warning message to be shown to the user

The POST-REDIRECT-GET pattern says that in response to a successful `POST`, you should return a `REDIRECT` response to a new URL, which will be followed by the browser making a `GET` to the new URL. If the user refreshes their browser now, they'll be refreshing the final `GET` call to the new URL. No additional `POST` is made, so no additional payments or side effects should occur.

This pattern is easy to achieve in ASP.NET Core applications using the pattern shown in listing 16.7. By returning a `RedirectToPageResult` after a successful `POST`, your application will be safe if the user refreshes the page in their browser.

You might be wondering why ASP.NET Core doesn't handle invalid requests for you automatically; if validation has failed, and you have the result, why does the page handler get executed at all? Isn't there a risk that you might forget to check the validation result?
