With Razor templates, generating this sort of dynamic content is simple. Listing 17.1 shows a template that could be used to generate the interface in figure 17.2. It combines standard HTML with C# statements and uses Tag Helpers to generate the form elements.

Listing 17.1 A Razor template to list users and a form for adding a new user

```
@page
@model IndexViewModel
<div class="row">                                          ❶
<div class="col-md-6">                                     ❶
<form method="post">
    <div class="form-group">
        <label asp-for="NewUser"></label>                  ❷
        <input class="form-control" asp-for="NewUser" />   ❷
        <span asp-validation-for="NewUser"></span>         ❷
    </div>
    <div class="form-group">
        <button type="submit"
          class="btn btn-success">Add</button>
    </div>
</form>
</div>
</div>

<h4>Number of users: @Model.ExistingUsers.Count</h4>       ❸
<div class="row">
<div class="col-md-6">
<ul class="list-group">
@foreach (var user in Model.ExistingUsers)                 ❹
{
<li class="list-group-item d-flex justify-content-between">
    <span>@user</span>
    <a class="btn btn-info"
        asp-page="ViewUser"                                ❺
        asp-route-userName="@user">View</a>                ❺
</li>
}
</ul>
</div>
</div>
```

❶ Normal HTML is sent to the browser unchanged.

❷ Tag Helpers attach to HTML elements to create forms.
