Having said that, just because you *can* do something doesn't mean you *should*. You'll find it much easier to work with, and maintain, your files if you keep them as simple as possible. This is true of pretty much all programming, but I find it to be especially so with Razor templates.

This section covers some of the more common C# constructs you can use. If you find you need to achieve something a bit more exotic, refer to the Razor syntax documentation at http://mng.bz/8rMw.

17.3.1 Using C# in Razor templates

One of the most common requirements when working with Razor templates is to render a value you've calculated in C# to the HTML. For example, you might want to print the current year to use with a copyright statement in your HTML, to give this result:

```
<p>Copyright 2022 ©</p>
```

Or you might want to print the result of a calculation:

```
<p>The sum of 1 and 2 is <i>3</i><p>
```

You can do this in two ways, depending on the exact C# code you need to execute. If the code is a single statement, you can use the `@` symbol to indicate you want to write the result to the HTML output, as shown in figure 17.4. You've already seen this used to write out values from the `PageModel` or from `ViewData`.
