❷ The if control structure checks the value of the PageModel's IsComplete property at runtime.

❸ The foreach structure will generate the <li> elements once for each task in Model.Tasks.

❹ A Razor expression is used to write the task to the HTML output.

This code definitely lives up to the promise of mixing C# and HTML! There are traditional C# control structures, such as `if` and `foreach`, that you'd expect in any normal C# program, interspersed with the HTML markup that you want to send to the browser. As you can see, the `@` symbol is used to indicate when you're starting a control statement, but you generally let the Razor template infer when you're switching back and forth between HTML and C#.

The template shows how to generate dynamic HTML at runtime, depending on the exact data provided. If the model has outstanding `Tasks`, the HTML generates a list item for each task, producing output something like that shown in figure 17.6.
