

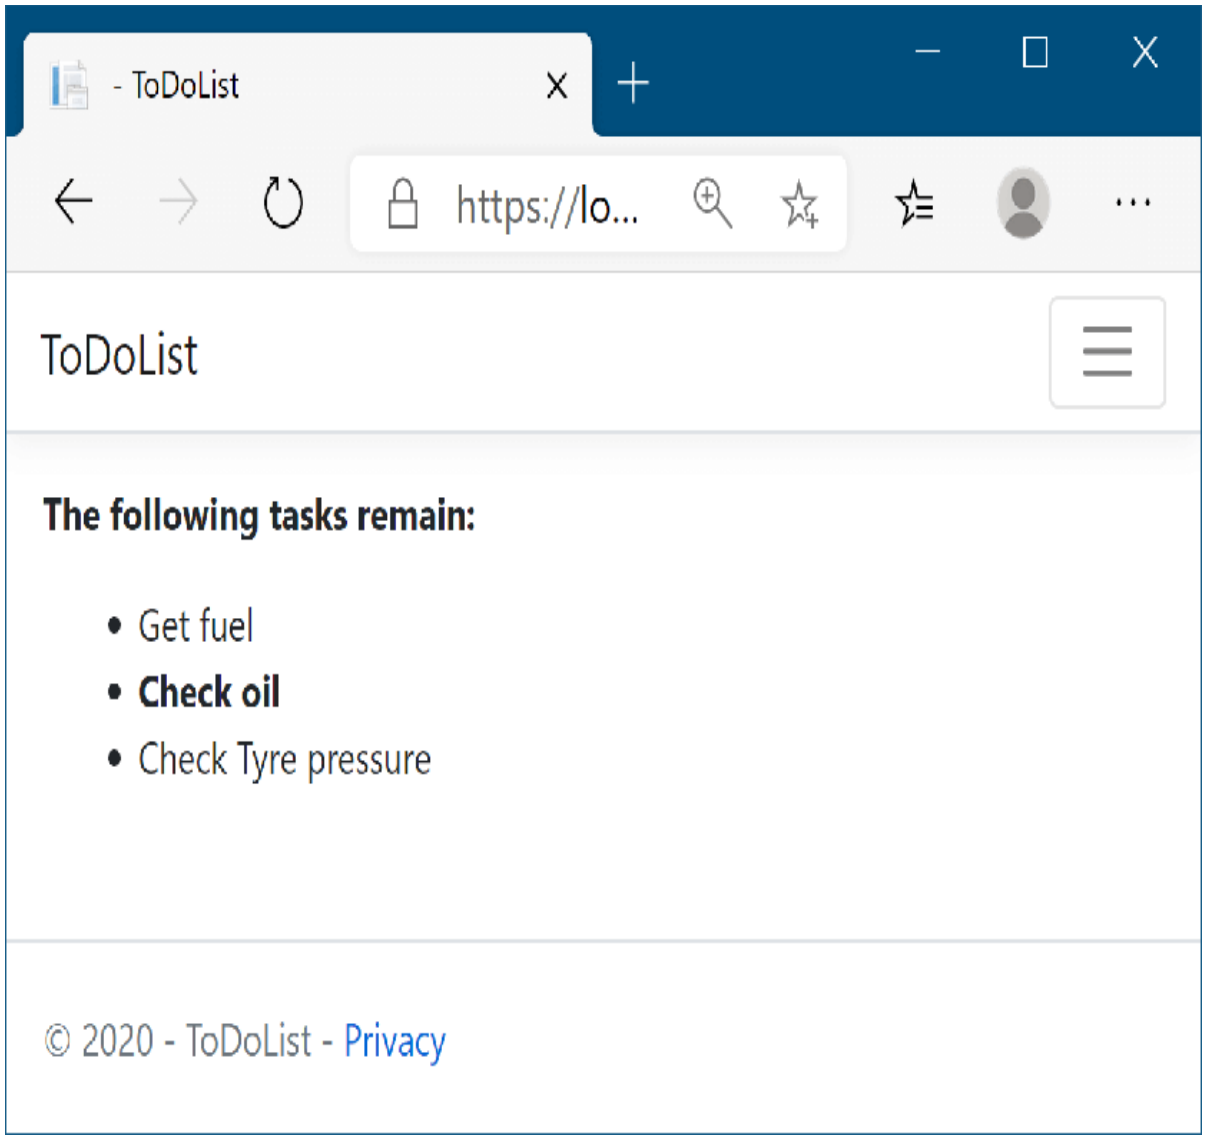

Figure 17.8 The second item, `"<strong>Check oil<strong>"` has been output using `Html.Raw()`, so it hasn't been HTML-encoded. The `<strong>` elements result in the second item being shown in bold instead. Using `Html.Raw()` in this way should be avoided where possible, as it is a security risk.

WARNING Using `Html.Raw` on user input creates a security risk that users could use to inject malicious code into your website. Avoid using `Html.Raw` if possible.
