- Loops and conditionals can be used to easily generate dynamic HTML in templates, but it's a good idea to limit the number of `if` statements in particular, to keep your views easy to read.
- If you need to render a `string` as raw HTML you can use `Html.Raw`, but do so sparingly; rendering raw user input can create a security vulnerability in your application.
- Tag Helpers allow you to bind your data model to HTML elements, making it easier to generate dynamic HTML while staying editor-friendly.
- You can place HTML common to multiple views in a layout to reduce duplication. The layout will render any content from the child view at the location `@RenderBody` is called.
- Encapsulate commonly used snippets of Razor code in a partial view. A partial view can be rendered using the `<partial />` tag.
- _ViewImports.cshtml can be used to include common directives, such as `@using` statements, in every view.
- _ViewStart.cshtml is called before the execution of each Razor Page and can be used to execute code common to all Razor Pages, such as setting a default layout page. It doesn't execute for layouts or partial views.
- _ViewImports.cshtml and _ViewStart.cshtml are hierarchical. Files in the root folder execute first, followed by files in controller-specific view folders.
