Setting the `asp-page` attribute allows you to specify a different Razor Page in your application that the form will be posted to when it's submitted. If you omit the `asp-page` attribute, the form will post back to the same URL it was served from. This is common with Razor Pages. You normally handle the result of a form post in the same Razor Page that is used to display it.

WARNING If you omit the `asp-page` attribute, you must add the `method="post"` attribute manually. It's important to add this attribute so the form is sent using the `POST` verb instead of the default `GET` verb. Using `GET` for forms can be a security risk.

The `asp-page` attribute is added by a `FormTagHelper`. This Tag Helper uses the value provided to generate a URL for the `action` attribute, using the URL generation features of routing that I described in chapters 5 and 14.

NOTE Tag Helpers can make multiple attributes available on an element. Think of them like properties on a Tag Helper configuration object. Adding a single `asp-` attribute activates the Tag Helper on the element. Adding more attributes lets you override further default values of its implementation.

The Form Tag Helper makes several other attributes available on the `<form>` element that you can use to customize the generated URL. I hope you'll remember that you can set route values when generating URLs. For example, if you have a Razor Page called Product.cshtml that uses the directive

```
@page "{id}"
```

the full route template for the page would be `"Product/{id}"`. To generate the URL for this page correctly, you must provide the `{id}` route value. How can you set that value using the Form Tag Helper?

The Form Tag Helper defines an `asp-route-*` wildcard attribute that you can use to set arbitrary route parameters. Set the `*` in the attribute to the route
