```
public class CheckoutModel: PageModel
{
    [BindProperty]
    public UserBindingModel Input { get; set; }
}
```

You can reference the `FirstName` property of the `UserBindingModel` by "dotting" into the property as you would in any other C# code. Listing 18.3 shows more examples of this.

```
<label asp-for="Input.FirstName"></label>
<label asp-for="Input.Email"></label>
```

As is typical with Tag Helpers, the Label Tag Helper won't override values that you set yourself. If, for example, you don't want to use the caption generated by the helper, you could insert your own manually. The code

```
<label asp-for="Email">Please enter your Email</label>
```

would generate this HTML:

```
<label for="Email">Please enter your Email</label>
```

As ever, you'll generally have an easier time with maintenance if you stick to the standard conventions and don't override values like this, but the option is there. Next up is a biggie: the Input and Textarea Tag Helpers.

18.2.3 The Input and Textarea Tag Helpers

Now you're getting into the meat of your form: the `<input>` elements that handle user input. Given that there's such a wide array of possible input types, there's a variety of ways they can be displayed in the browser. For example, Boolean values are typically represented by a `checkbox` type `<input>` element, whereas integer values would use a `number` type `<input>` element, and a date would use the `date` type, as shown in figure 18.5.
