This will add an extra `<option>` at the top of your `<select>` element, with a blank `Value` attribute, allowing you to provide a “no selection” option for the user.

TIP Adding a “no selection” option to a `<select>` element is so common that you might want to create a partial view to encapsulate this logic.

With the Input Tag Helper and Select Tag Helper under your belt, you should be able to create most of the forms that you’ll need. You have all the pieces you need to create the currency converter application now, with one exception.

Remember that whenever you accept input from a user, you should always validate the data. The Validation Tag Helpers provide a way for you to display model validation errors to the user on your form without having to write a lot of boilerplate markup.

18.2.5 The Validation Message and Validation Summary Tag Helpers

In section 18.2.3 you saw that the Input Tag Helper generates the necessary `data-val-*` validation attributes on form input elements themselves. But you also need somewhere to display the validation messages. This can be achieved for each property in your view model using the Validation Message Tag Helper applied to a `<span>` by using the `asp-validation-for` attribute:

```
<span asp-validation-for="Email"></span>
```

When an error occurs during client-side validation, the appropriate error message for the referenced property is displayed in the `<span>`, as shown in figure 18.8.
