So far in this chapter you've seen how to use Tag Helpers for forms, link generation, and cache busting. You can also use Tag Helpers to conditionally render different markup depending on the current environment. This uses a technique you haven't seen yet, where the Tag Helper is declared as a completely separate element.

18.5 Using conditional markup with the Environment Tag Helper

In many cases, you want to render different HTML in your Razor templates depending on whether your website is running in a development or production environment. For example, in development you typically want your JavaScript and CSS assets to be verbose and easy to read, but in production you'd process these files to make them as small as possible. Another example might be the desire to apply a banner to the application when it's running in a testing environment, which is removed when you move to production, as shown in figure 18.11.
