- The Input Tag Helper sets the `type` attribute of an `<input>` element to the appropriate value based on a bound property's `Type` and any `DataAnnotation` attributes applied to it. It also generates the `data-val-*` attributes required for client-side validation. This significantly reduces the amount of HTML code you need to write.
- To enable client-side validation, you must add the necessary JavaScript files to your view for jQuery validation and unobtrusive validation.
- The Select Tag Helper can generate drop-down `<select>` elements as well as list boxes, using the `asp-for` and `asp-items` attributes. To generate a multiselect `<select>` element, bind the element to an `IEnumerable` property on the view model. You can use these approaches to generate several different styles of select box.
- The items supplied in `asp-for` must be an `IEnumerable<SelectListItem>`. If you try to bind another type, you'll get a compile-time error in your Razor view.
- You can generate an `IEnumerable<SelectListItem>` for an `enum TEnum` using the `Html.GetEnumSelectList<TEnum>()` helper method. This saves you having to write the mapping code yourself.
- The Select Tag Helper generates `<optgroup>` elements if the items supplied in `asp-for` have an associated `SelectListGroup` on the `Group` property. Groups can be used to separate items in select lists.
