

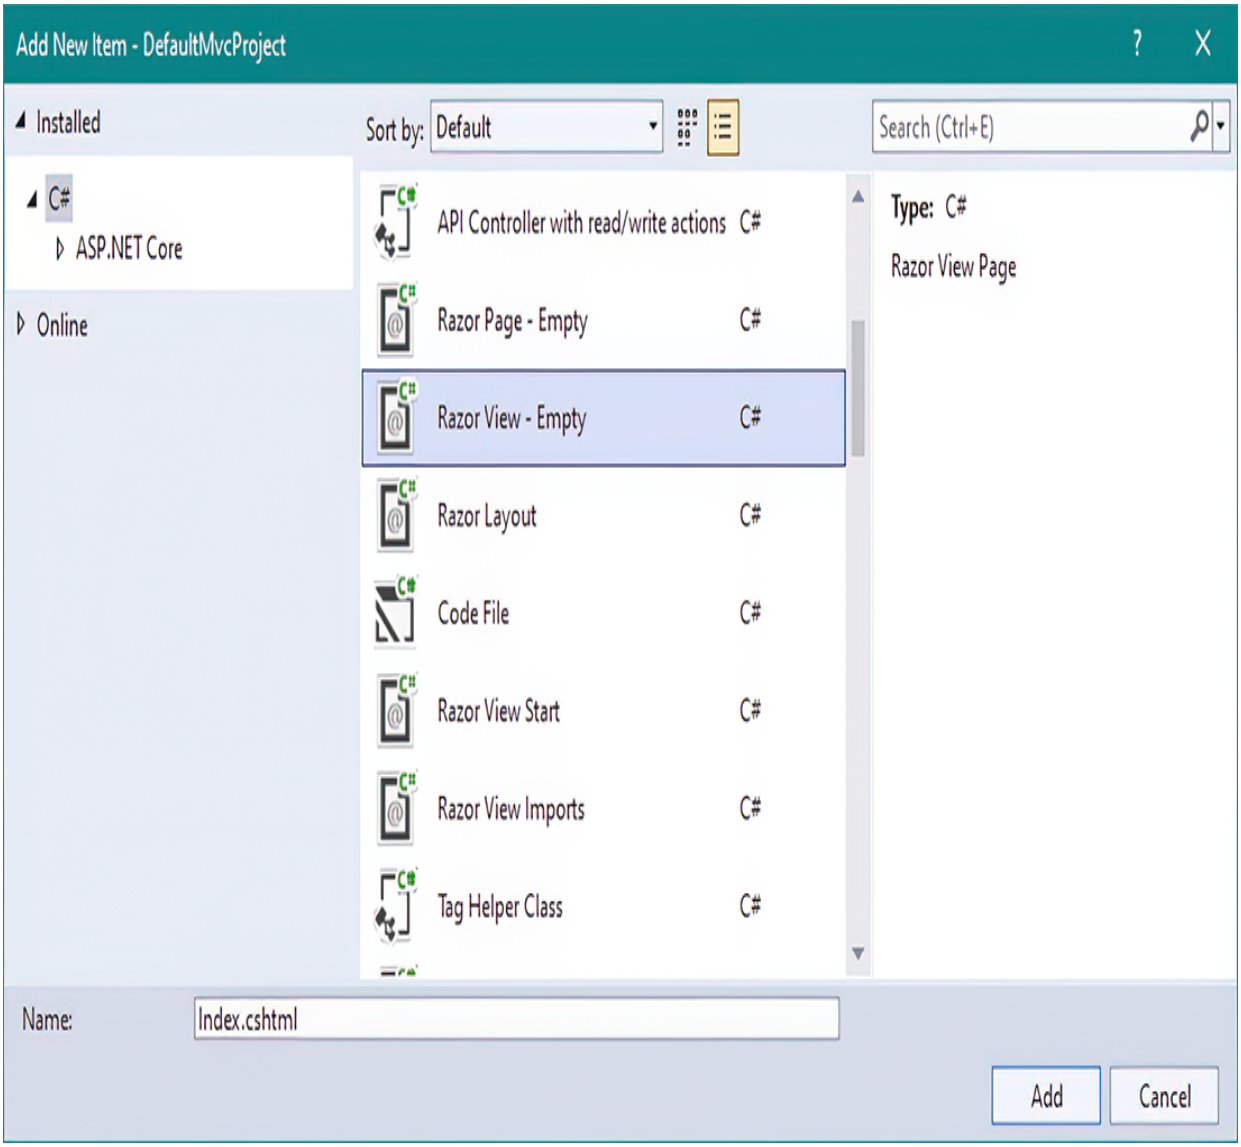

Figure 19.5 The Add New Item dialog box. Choosing Razor View - Empty adds a new Razor view template file to your application.

Razor view files are almost identical to the Razor Page .cshtml files you saw in chapter 17. The only difference is that Razor view files must not specify a `@page` directive at the top of the file. Aside from that, they're identical; you can use the same syntax, partial views, layouts, and view models as you can with Razor Pages.
