template also adds the OpenAPI services and endpoints required by the Swagger UI, as you saw in chapter 11.

**Listing 20.1 Program.cs for the default web API project**

```
sWebApplicationBuilder builder = WebApplication.CreateBuilder(args);

builder.Services.AddControllers();                    ❶

builder.Services.AddEndpointsApiExplorer();           ❷
builder.Services.AddSwaggerGen();                     ❷

WebApplication app = builder.Build();

if (app.Environment.IsDevelopment())
{
    app.UseSwagger();                                 ❸
    app.UseSwaggerUI();                               ❸
}

app.UseHttpsRedirection();
app.UseAuthorization();

app.MapControllers();                                 ❹

app.Run();
```

❶ AddControllers adds the necessary services for web API controllers to your application.

❷ Adds services required to generate the Swagger/OpenAPI specification document

❸ Adds Swagger UI middleware for exploring your web API endpoints

❹ MapControllers configures the web API controller actions in your app as endpoints.

The program in listing 20.1 instructs your application to find all the web API controllers in your application and configure them in the `EndpointMiddleware`. Each action method becomes an endpoint and can receive requests when the `RoutingMiddleware` maps an incoming URL to the action method.

**NOTE** Technically, you can include Razor Pages, minimal APIs, and web API controllers in the same app, but I prefer to keep them separate where
