```
    [Route("api/car/speed/{speed}")]   ❶
    [Route("set-speed/{speed}")]
    public IActionResult SetCarSpeed(int speed)
    {
         /* method implementation*/
    }
}
```

❶ Multiple route templates use the same “api/car” prefix.

There’s quite a lot of duplication here; you’re adding `"api/car"` to most of your routes. Presumably, if you decided to change this to `"api/vehicles"`, you’d have to go through each attribute and update it. Code like that is asking for a typo to creep in!

To alleviate this pain, it’s possible to apply `RouteAttribute`s to controllers, in addition to action methods. When a controller and an action method both have a route attribute, the overall route template for the method is calculated by combining the two templates.

Listing 20.7 Combining `RouteAttribute` templates

```
[Route("api/car")]
public class CarController
{
    [Route("start")]                                ❶
    [Route("ignition")]                             ❷
    [Route("/start-car")]                           ❸
    public IActionResult Start()
    {
         /* method implementation*/
    }

    [Route("speed/{speed}")]                        ❹
    [Route("/set-speed/{speed}")]                   ❺
    public IActionResult SetCarSpeed(int speed)
    {
         /* method implementation*/
    }
}
```
