Listing 22.1 Recipe web API controller before refactoring to use filters

```
[Route("api/recipe")]
public class RecipeApiController : ControllerBase
{
    private readonly bool IsEnabled = true;                    ❶
    public RecipeService _service;
    public RecipeApiController(RecipeService service)
    {
        _service = service;
    }

    [HttpGet("{id}")]
    public IActionResult Get(int id)
    {
        if (!IsEnabled) { return BadRequest(); }               ❷
        try
        {
            if (!_service.DoesRecipeExist(id))                 ❸
            {                                                  ❸
                return NotFound();                             ❸
            }                                                  ❸
            var detail = _service.GetRecipeDetail(id);         ❹
            Response.GetTypedHeaders().LastModified =          ❺
                detail.LastModified;                           ❺
            return Ok(detail);                                 ❻
        }
        catch (Exception ex)                                   ❼
        {                                                      ❼
            return GetErrorResponse(ex);                       ❼
        }                                                      ❼
    }

    [HttpPost("{id}")]
    public IActionResult Edit(
        int id, [FromBody] UpdateRecipeCommand command)
    {
        if (!IsEnabled) { return BadRequest(); }               ❽
        try
        {
            if (!ModelState.IsValid)                           ❾
            {                                                  ❾
                return BadRequest(ModelState);                 ❾
            }                                                  ❾
            if (!_service.DoesRecipeExist(id))                 ❿
```
