- Resource filters run after authorization filters and again after an `IActionResult` has been executed. They can be used to short-circuit the pipeline so that an action method is never executed. They can also be used to customize the model-binding process for an action method.
- Action filters run after model binding has occurred and before an action method executes. They also run after the action method has executed. They can be used to extract common code out of an action method to prevent duplication. They don't execute for Razor Pages, only for MVC controllers.
- The `ControllerBase` base class also implements `IActionFilter` and `IAsyncActionFilter`. They run at the start and end of the action filter pipeline, regardless of the ordering or scope of other action filters. They can be used to create action filters that are specific to one controller.
- Page filters run three times: after page handler selection, after model binding, and after the page handler method executes. You can use page filters for similar purposes as action filters. Page filters execute only for Razor Pages; they don't run for MVC controllers.
- Razor Page `PageModels` implement `IPageFilter` and `IAsyncPageFilter`, so they can be used to implement page-specific page filters. These are rarely used, as you can typically achieve similar results with simple private methods.
- Exception filters execute after action and page filters, when an action method or page handler has thrown an exception. They can be used to provide custom error handling specific to the action executed.
