- **Action**: “view” or “edit”
- **Resource**: any document where the employee is the owner

This scoped structure allows this policy to be selected and evaluated when someone tries to view a document they own; it doesn’t apply to unrelated actions or resources.

7.2.3 Conditions: under what circumstances

Conditions are boolean expressions that must be true for the policy to apply. Conditions further define the policy. They are optional but often necessary. They enable policies to consider dynamic contexts, including attributes of the principal, resource, or environment. Common examples include:

- Time of day
- Device trust status
- Department or team membership
- On-call status

In ACME’s deployment tools, conditions enable security engineers to safeguard their applications from unauthorized deployments. For example:

- The engineer must be using a company-managed device.
- If it’s outside business hours, they must also be on call.
- Their clearance level must be sufficient for the deployment pipeline they’re working on.

These rules aren’t part of the scope. Instead, they exist within the condition logic, making policies flexible without becoming unwieldy.

7.2.4 Putting it together

Effect, scope, and conditions are the foundation of a policy contract: “This principal is permitted (or forbidden) to take this action on this resource, if these conditions are true.”
