When the Cedar engine receives this request, it searches for policies whose scope matches the principal, action, and resource. The policy shown in figure 7.1 specifies the following:

- `principal in Employee::*`
- `action in ["view", "edit"]`
- `resource in Document::*`

That scope clearly matches Bob's request. Next, the engine evaluates the policy's conditions, which specify:

- `resource.owner == principal`: Bob is the owner of doc456, so this is true.
- `context.device.is_managed == true`: Bob is using a managed device, so this is also true.

Since both the scope and conditions match, and the policy has a `permit` effect, the engine grants a decision of `allow`.
