```
{
  "Version": "2012-10-17"
  "Statement": [
    {
     "Effect": "Allow",
     "Action": "s3:GetObject",
     "Resource": "arn:aws:s3:::acme-docs/*",
     "Condition": {
       "StringEquals": {
         "aws:PrincipalTag/department":
          "${s3:ExistingObjectTag/owner-department}"
       "StringEqualsIfExists": {
         "s3:ExistingObjectTag/confidential": "true"

       }
     }
    }
  ]
}
```

This policy encodes the intent of the earlier English statement in JSON, granting a read (`s3:GetObject`) if the object's `confidential` tag is `"true"` and the departments match.

IAM's `Condition` block is where much of its expressiveness resides; it's the AWS equivalent of the `when` clause in Cedar or the rule body in Rego. By leveraging Identity Center as the authoritative identity source and IAM's tag-based conditions, ACME can enforce fine-grained, attribute-based access control entirely within AWS's native authorization system.
