- Context: Rich, strongly typed attribute support; compatible with external data sources.
- Strengths: Clear and concise syntax, structural scoping; portable, and embeddable.
- Limitations: Newer ecosystem with fewer integrations compared to OPA.

Cedar provides a unifying approach: typed principals, actions, and resources; built-in structural scoping; and the flexibility to model attributes, relationships, and context, making it a strong candidate for teams seeking the precision of IAM and the developer accessibility that XACML never achieved.

8.5.6 From strengths to selection

The preceding sections provide attributes for different policy languages and frameworks, but what do these mean when selecting an authorization system? Figure 8.3 shows a strength map for the policy languages we've discussed.
