```
{
  "principal": "ACME::Employee::\"emp:alice\"",
  "action": "ACME::\"doc:share\"",
  "resource": "ACME::Document::\"doc:Q3-plan\"",
  "context": {
    "device": { "managed": true },
    "timeOfDay": "14:05"
  }
}
```

The PEP guarantees that each evaluation request is

- Complete— all required attributes and entity references for the policies are included.
- Consistent—entity and attribute names match the Cedar schema.
- Scoped—ensures the correct principal, action, or resource is used, even when multiple options are involved.

At ACME, the PEP, which they call the *Policy Enforcement Agent*, is part of the service's authorization middleware, which operates between API handlers and business logic. This component invokes Cedar for each protected operation—whether initiated by a web request, a scheduled job, or a service-to-service call—ensuring policies are applied consistently.

Getting the PEP right is crucial: well-crafted policies are worthless if the evaluation request doesn't align with the actual operation being performed.
