- Delegatable rights are managed explicitly, distinguishing between “using a resource” and “granting access to a resource.”
- Global constraints enforce zero-trust principles by applying organization-wide ABAC rules, such as device trust checks.
- Policy templates and overrides minimize duplication, maintain consistency, and allow for local exceptions when necessary.
- The Policy Enforcement Point (PEP) translates real requests into Cedar evaluations, making sure that each access decision is enforced consistently.
- Testing and static analysis safeguard your policy set, catching logic errors, regressions, and contradictions before they reach production.
- Cedar’s blend of clarity, flexibility, and rigor makes it a practical language for unifying authorization across complex systems.
- Together, these lessons demonstrate how ACME and you can go beyond theory and implement Cedar, transforming authorization from scattered checks into a unified, strategic advantage.
