```
permit(
    principal,
    action == Action::"doc:view",
    resource in Document::"legal-drafts"
)
when { principal.title == "Associate Counsel" };
```

At the time, this policy seemed reasonable. The legal team was small, and the Associate Counsel role was the only position that required access to drafts. Checking for that title directly was an easy way to meet the requirement. But the policy depended on a volatile attribute. As soon as Dan's title changed to Senior Counsel, the policy no longer matched reality. Even though his overall responsibilities had changed, he still needed access to legal drafts.

IMPROVED POLICY (TIED TO DURABLE TEAM MEMBERSHIP)

Here's the more stable design that ACME adopted:

```
permit(
    principal in Team::"team:legal",
    action == Action::"doc:view",
    resource in Document::"legal-drafts"
);
```

This version links access to membership in the legal team, which is updated automatically in the HR system. Dan keeps his access after his promotion because he remains a member of the legal team, even though his job title has changed.

By anchoring policies to stable entities like teams or projects instead of fragile attributes like job titles, ACME ensures that authorization decisions stay aligned with business reality as the organization changes. Job-title checks might seem like a quick fix for small teams, but they don't scale well. As organizations expand and career paths become more diverse, titles change much more frequently than team responsibilities. Creating policies based on stable entities helps prevent unexpected failures and lowers ongoing maintenance burdens.
