critical employees away from work that advances the organization's products and services.

- **Improved onboarding and offboarding efficiency**—dynamic authorization can ensure that new employees or contractors have all the access they need on day one and lose it as soon as they leave.

Improved operational efficiency gives the organization the freedom to explore and grow instead of constantly battling access management problems.

1.5.2 Enabling business agility and innovation

As more business is conducted online, organizations are finding that it's vital to react quickly to changing business needs. Whether an organization is launching a new product, expanding into new markets, reacting to new regulatory requirements, or enabling new partnerships, flexibly adapting to emerging requirements and supporting innovation is table stakes for successful organizations.

As we've discussed, static authorization methods require manual changes to lists and groups to increase or decrease access to systems. For example, a financial services firm that is employing external auditors for compliance reviews must grant access for the duration of the engagement. A dynamic authorization system makes this as easy as a policy change. Even that might not be required if authorization policies have been written to anticipate this kind of need.

New products often require custom code to support authorization requirements for customers and administrators. For example, a workforce management SaaS provider launching a new employee onboarding product must ensure that customers can properly authorize different access levels for their employees to administer and manage the service securely. The company can integrate a dynamic authorization system with the new product, allowing developers to build the right authorization controls without writing custom authorization software.
