1.5.3 Improving customer experience

The compelling features of modern SaaS applications, marketplaces, and collaborative services rely on carefully managing access. In these platforms, dynamic authorization isn’t just about security—it enhances personalized user experiences by speeding up service provisioning, providing the right access at the right time, and enabling features like delegated access, team sharing, or tiered functionality. It also creates new revenue opportunities by facilitating the enforcement of subscription levels, usage-based pricing, or pay-per-feature models without hardcoding access logic.

For example, platforms like Google Docs, Dropbox, and SmugMug all allow their customers to share content with specific people or groups. Dynamic authorization makes this functionality possible.

Or consider multi-tenant SaaS companies like Workday or Salesforce. Fine-grained authorization allows these companies to isolate customer data while simultaneously allowing granular access within each tenant that follows complex rules. These companies can’t build a single access management system because each tenant requires different access controls depending on their organization, regulatory environment, and internal access policies. Dynamic authorization lets them more easily meet customer needs.

Finally, many online businesses offer different features to different users depending on subscription levels. Dynamic authorization policies allow this to be done without custom code and give the business flexibility to add or modify subscription levels and features without changing the underlying code.

1.5.4 Strengthening security and compliance

We've discussed the advantages of using dynamic authorization in security and regulatory compliance in the preceding sections, but it’s worth considering the business advantages that it provides. Industries like finance, healthcare, and government are heavily regulated. The regulations require organizations to enforce least privilege access, ensure auditability, and dynamically adjust access based on employee roles and changing risk conditions. Organizational benefits from using dynamic authorization
