

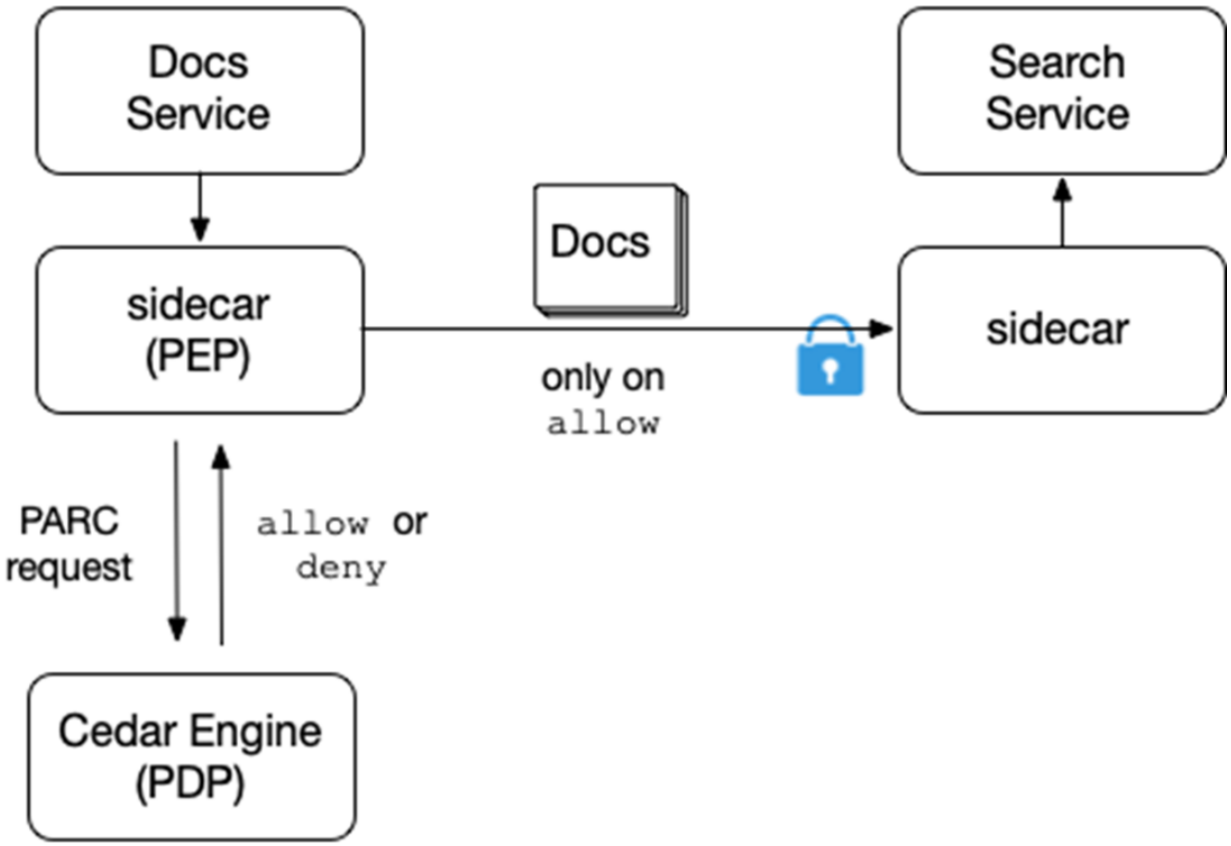

Figure 11.2 Service mesh enforcement with sidecars. Cedar evaluates each document sent from Docs to Search. Documents tagged "Legal" are denied; others are allowed.

When Carol opened her Manager Dashboard and drilled into customer assignments, the dashboard retrieved document metadata from the Collaboration platform. This, in turn, triggered the Docs service to request indexing from Search. The Docs service fetched documents from its repository and sent them one by one to Search for indexing. Each outbound request went through the Docs sidecar, which built the PARC request.

Alice's team created Cedar policies to address the security concerns highlighted by the product manager for the Docs service. For example, by default, the Docs service indexes documents unless the document is labeled "Legal." The policy was straightforward: a single `permit` statement with an `unless` clause for legal documents:
