include decreased compliance risk, better employee experience, fewer workarounds that introduce security problems, and reduced overall cost.

1.5.5 Competitive differentiation

Using dynamic authorization inside products gives organizations a competitive edge by offering a more secure, flexible, and user-friendly product.

For example, a B2B SaaS company with a product built with fine-grained access control can better attract large enterprise customers who demand flexible, yet secure features. A financial services company that lets customers dynamically set transaction limits based on varying risk signals allows them to reduce fraud while maintaining a rich user experience. A collaboration tool that offers flexible, secure content sharing beats out competitors who use more rigid, static sharing models.

When access management is as simple as a policy change, organizations can more easily respond to a competitor’s product changes. And dynamic authorization provides these benefits without developers having to write custom code.

1.5.6 A business necessity

The preceding sections offer multiple examples of how dynamic authorization goes well beyond enhanced IT security. Organizations that embrace dynamic authorization gain enhanced operational efficiency through automation, increased business agility to more easily pursue new opportunities, stronger security and compliance with less overhead, and better customer experiences that drive customer engagement and revenue.

In the era of multi-tenant, AI-enhanced SaaS applications, dynamic authorization is essential for organizations to securely scale and effectively compete. Failing to adopt better access management technologies and mechanisms puts organizations at risk of losing their competitive advantage.
