CLIENT CREDENTIALS GRANT

The *Client Credentials Grant* issues a token that represents an application, not an individual. This makes it the ideal choice for headless, tenant-approved integrations that need to operate continuously—like CustCo's Task App that Jack relies on.

Jack's customer success team uses a task management system—the Task App—for all daily tasks. This is where they track assignments, set deadlines, and monitor progress. Meanwhile, much of CustCo's collaboration with ACME happens in the Customer Collaboration platform, where proposals, onboarding plans, and support documents are stored. The issue is that workflows often start in Collaboration but need to be completed in the Task App.

Without integration, Jack's team must manually copy tasks between systems. Deadlines are missed, tasks get lost, and managers cannot see a full picture of work. By connecting the Task App with ACME's Collaboration platform, CustCo ensures that:

- When an action item is created in Collaboration, a corresponding task automatically appears in the Task App.
- When a task is finished in the Task App, the status updates in the Collaboration workspace.
- CustCo employees continue using their familiar tool, while ACME employees stay in Collaboration—without losing context.

This type of synchronization must run 24/7, regardless of whether Jack is signed in. That's why CustCo can't rely on a user token. Instead, it uses the Client Credentials Grant, where the Task App authenticates as itself.

Before the Task App can request tokens, it must first be installed in the Customer Collaboration platform and explicitly linked to CustCo's tenant; this occurs once during setup:

1. The CustCo admin installs the Task App in ACME's Customer Authentication service and approves narrow scopes:
