```
collab:task.read, collab:task.write, collab:doc.meta.read, and colla
b:event.subscribe.
```

2. ACME creates a record of the installation, linking the app to CustCo, for example:

```
IntegrationInstall{id="custco-tasks", tenant="CustCo", allowed_works
paces=["custco-sales","custco-support"]}
```

This installation record acts as the reference point for policy: it shows which tenant owns the app and what resources it is authorized to access.

Once installed, the Task App can acquire tokens on its own, without any user interaction. Figure 11.7 illustrates the flow of the credential grant:

1. The Task App authenticates to ACME’s authorization server using its `client_id` and `client_secret` and requests the `client_credentials` grant for the approved scopes.
2. The authorization server verifies the credentials and responds with an access token, where the subject is the integration principal (the app), not a user.
