```
POST /tasks
Authorization: Bearer <access_token>
Body:
{
  "workspace": "custco-sales",
  "docId": "abc123",
  "title": "Follow up with customer",
  "assignee": "sam@custco.com",
  "dueDate": "2025-10-15",
  "requested_by": "jack@custco.com"   // attribution added by the ap
p
}
```

At the gateway, the token is verified and the app's Installation record is retrieved (`tenant = CustCo; allowed_workspaces = [custco-sales, custco-support]`). Then the gateway constructs a PARC request for Cedar:

```
{
  "principal": {
    "type": "ACME::Integration",
    "id": "custco-tasks",
    "attrs": {
      "tenant": "CustCo",
      "allowed_workspaces": ["custco-sales","custco-support"]
    }
  },
  "action": "collab:task.write",
  "resource": { "type": "ACME::Workspace", "id": "custco-sales" },
  "context": {
    "token_scopes": ["collab:task.write","collab:doc.meta.read"],
    "requested_by": "jack@custco.com"
  }
}
```

Cedar assesses the request based on integration-focused policies. The first ties the app to CustCo and only the installed workspaces; the second is an optional guardrail that requires human attribution on writes:
