WE'RE NOT CHANGING HOW SHARING WORKS

Section 6.1, "Relationship-based access control," introduced the ReBAC model ACME used to control sharing inside the Customer Collaboration platform. That remains unchanged.

C³'s authorization functions on two separate levels:

1. Platform-level authorization (managed by ACME)

This layer governs how the Customer Collaboration Cloud itself functions as a multi-tenant service. It's responsible for enforcing tenant isolation, routing requests to the correct entity and policy namespace, and applying global governance policies such as device trust, compliance, and export controls.

Every authorization request passes through this layer first, ensuring that a principal from one tenant can't reach into another and that every decision is evaluated within the right tenant context.

2. Tenant-level authorization (managed by customers)

Inside each tenant, C³ uses Relationship-Based Access Control (ReBAC) to manage document sharing and collaboration. These rules are identical across tenants; what differs is each tenant's data—their relationship graph of who owns, edits, or views what—and the templates they can choose from to adjust sharing behavior (for example, allowing external viewers or restricting delegated access).

Here's a simplified version of the ReBAC policy that governs sharing within a tenant:
