into a product that would onboard multiple organizations, each with their own set of customers, those assumptions broke down:

- No tenant isolation: all data resides in the same namespace.
- Inflexible identity: users outside ACME's directory needed custom workarounds.
- Duplicate logic: each service re-implemented its own boundary checks.
- Opaque policy: no centralized location to audit or reason about access decisions.

The ReBAC sharing model from Section 6.1 remains the core of collaboration within each tenant, but the surrounding enforcement logic required a complete redesign. To turn the Customer Collaboration platform into the Customer Collaboration Cloud (C^3), ACME had to externalize the platform-level authorization that defines its overall security boundary, separating authentication, tenancy, and policy evaluation into distinct, composable layers.
