relationship graph and entity data are tenant-specific and loaded dynamically for each request, so the PDP applies the same policies to different data for each tenant. This design provides consistent behavior while keeping operational costs low.

DEDICATED PDP INSTANCES

Premium tenants can provision a dedicated PDP instance, deployed in their preferred region or private environment. These instances still inherit ACME's global schema and governance layer but allow controlled policy customization. Tenants can extend or override the standard ReBAC policies using approved templates, enabling customers to enforce domain-based sharing restrictions or custom retention rules.

Dedicated PDPs offer better isolation and greater flexibility while remaining compatible with C³'s evaluation process. They are ideal for regulated industries or large enterprise clients who need to integrate their own compliance controls directly into their decision-making process.

By organizing authorization this way, C³ maintains a consistent architectural pattern—C³ PDP for platform governance and tenant PDPs for collaboration—while allowing each tenant to choose how much control they want over their own policy environment.

13.4.3 Authorization flow request

Every authorization decision in C³ passes through two layers of evaluation. The first layer enforces ACME's global governance policies, which protect the platform itself. The second layer applies each tenant's ReBAC policies, which control collaboration within that tenant's namespace. Together, they ensure that system-wide compliance and tenant-level sharing function as one smooth process.

Figure 13.2 shows this flow, tracing how a single request moves from the PEP through both PDP layers before a final decision is returned to the application.
