- Entities like `C3::Tenant`, `C3::CustomerUser`, and `C3::Document` are defined once, so both application and tenant policies refer to the same canonical types.
- Actions (`doc:view`, `doc:edit`, `doc:share`) are registered centrally, but tenants can implement policy templates that limit or expand these actions within their own space. (See the sidebar “How a policy template shapes tenant control” for additional details on how this works.)
- Validation occurs before deployment: policies are type-checked against the schema and simulated with representative data to ensure they won’t cause runtime errors or unsafe overrides.

This shared schema and templates ensure that a tenant’s customization never disrupts the platform's underlying policy logic.
