ACME'S POLICY REVIEW BOARD

ACME's Policy Review Board is operated by the Access Control Coordinating Council and functions as the company's official forum for reviewing authorization policies and templates. The board meets monthly, bringing together coordinators, auditors, and representatives from engineering, product, and operations. Its mission is twofold: to ensure policies align with company standards and to learn from real-world outcomes.

Before each meeting, the coordinators prepare a dashboard that summarizes:

- All new or revised policies pending review
- Any suggested modifications to policy templates
- ADRs related to major architectural or compliance choices
- All open and recently resolved operational incidents in which access control played a role

During the meeting, authors or approvers briefly present new policies and summarize the rationale from their ADRs. The board verifies that policies and templates have passed automated testing, code review, and approval workflows. Incidents from the ticketing system are discussed to identify systemic patterns—such as recurring privilege issues or drift between teams—and the board may assign follow-up actions to update templates or implement new controls.

Board outcomes are recorded in the governance repository. Each decision is documented as an ADR and linked to relevant policy IDs and incident tickets. This traceability enables ACME to demonstrate not only that policies are technically accurate but also that governance decisions are intentional, documented, and auditable.

By integrating engineering data, operational feedback, and governance oversight, the policy review board ensures that authorization stays consistent across the organization.
