- The credential has not expired.

These checks depend on ACME’s trust store and mapping rules, not on any issuer-specific details embedded in the policy. If ACME later trusts additional certification bodies accredited by NISA, this policy remains unchanged.

This model provides ACME with the advantages of externalized authorization without involving policies in the details of credential verification. If ACME later adds another accredited auditing firm, no policies need to change. If NISA updates its certification program, only the trust store and mapping rules require adjustments. The policies that govern access stay consistent because they rely on attributes, not on how those attributes were obtained.
