combination of presentation verification by the PEP and policy enforcement at the PDP ensures that a supplier employee can view or update a purchase order only if all these conditions are true:

- The employee works for the supplier listed on the order.
- The supplier has delegated authority for the relevant contract.
- The delegation credential has not expired or been revoked.

With this model, authorization follows the natural hierarchy of the business relationship: manufacturer → supplier → supplier employee. ACME no longer needs to manage identities or roles for individuals working several tiers away in the supply chain. Authority flows through verifiable credentials, not through manual account creation or fragile directory integrations. Access automatically updates as delegations and employment relationships change, reducing the administrative burden and security risks of outdated accounts.

16.8.2 Clinic integration: Clinicians from external organizations

ACME Health works with clinics that are not included in the platform's internal identity system. Physicians, nurses, and administrative staff often need temporary or conditional access to patient data, test results, and appointment information. Originally, this was handled through federation agreements or manually created accounts, but verifiable credentials offer a cleaner, more flexible solution.

In this model, clinicians possess credentials issued by their licensing authorities and their employing clinic. When a clinician tries to access ACME Health systems, the PEP requests attributes describing these factors:

- The clinician's professional license
- Their affiliation with a specific clinic
- The clinician's relationship to the patient or care team

ACME verifies the presentation using the protocol-flexible verification layer described earlier and establishes trust in issuers through jurisdiction-specific
