accreditation frameworks for clinical organizations and medical licensing boards.

Policies can then require these conditions, for example:

- The clinician is licensed in the relevant jurisdiction.
- The employing clinic has a valid business relationship with ACME Health.
- The clinician is assigned to the patient's care team.

No long-term accounts are needed, and access automatically aligns with current licensure, employment, and patient assignments.

16.8.3 Field technicians: Employer-issued scope-of-work credentials

ACME offers operational tools for companies that dispatch technicians to the field for installation, maintenance, and repair work. These technicians are employed by service partners, not by ACME, and their authority depends on their employer, role, training, and assigned service area.

Service partners issue credentials that detail a technician's employment, role, and authorized service scope. When a technician logs into ACME's service (often from a mobile device), the PEP requests the attributes needed by policy: role, region, product certifications, and employer.

The verification layer validates the credentials, and the PDP evaluates policies such as:

- Technicians may only access documentation or configuration tools for the product lines they are certified to service.
- Technicians may only initiate work orders within their assigned region.
- Certain high-risk operations require both employer authorization and recent completion of a safety-training credential.

This allows ACME's platform to support flexible, widely spread field operations for its customers without maintaining its own technician directory
