- Revocation and expiration checks ensure that credential-based attributes stay current and valid when making decisions.
- Verification services can be built to accept presentations from various credential protocols and wallet types.
- Normalizing credential claims into consistent attributes simplifies authorization policies and decoupled from credential formats.
- Policies evaluate attributes, not credentials, enabling new issuers or credential types to be added without modifying policy logic.
- Credential-based access is particularly useful when authority resides outside the relying system or when participants frequently change.
- Exception workflows can allow controlled access when presentations are incomplete or credential requirements are not met.
- Incremental adoption, beginning with narrow, well-governed use cases, reduces operational risk and builds confidence in credential-based authorization.
