- Decision logs offer the evidence necessary to understand how authorization behaves in practice.
- AI-assisted analysis helps reveal unexpected outcomes, edge cases, and policy interactions.
- Governance relies on observable actions, not guessed intentions or likely explanations.
- In retrieval-augmented generation systems, retrieval serves as the proper enforcement point.
- Authorizing before retrieval prevents unauthorized data from ever entering an AI model’s context.
- Policy residuals can be utilized to convert authorization results into retrieval constraints.
- Architecture, not prompts, determines whether AI-enabled systems are safe by construction.
- Accountability emerges when decisions are traceable from outcomes back to policy and ownership.
- Policy becomes a practice when authoring, observation, and governance form a continuous loop.
