

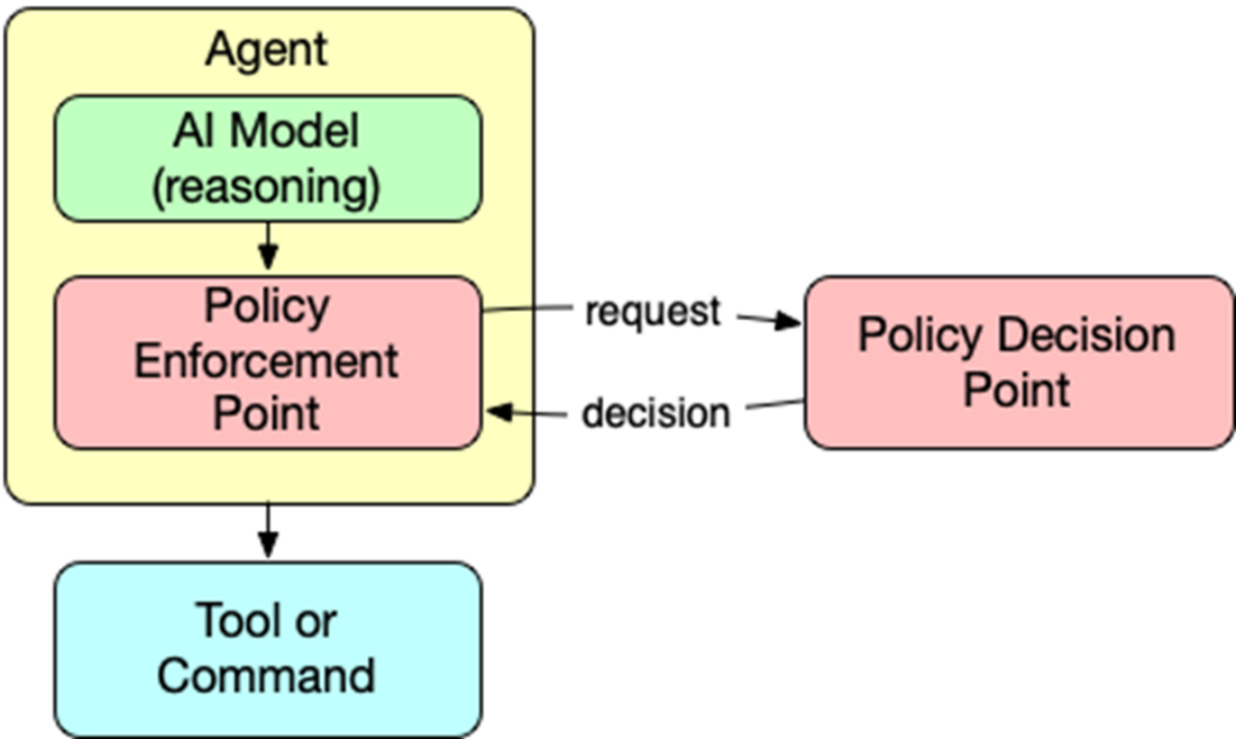

Figure 18.1 Authorization during agent tool invocation. When an agent invokes a tool or command, the request passes through a policy enforcement point. The enforcement point asks the policy decision point whether the action is permitted before the tool executes.

For ACME, this architecture reinforced Trudy's earlier conclusion: authorization could not simply sit at the edge of the system. It had to be embedded in the interaction between agents and the tools they use.

Next, we will explore how ACME integrated policy evaluation directly into the agent's execution loop.
