NOTE

Appendix C.6 provides a working demonstration of this pattern. The delegation demo shows how a main agent creates a delegation record for a subagent and how the policy enforcement point and Cedar policies enforce those constraints on every action the subagent attempts.

18.6.1 Delegation as data

When treating delegation as data, a primary agent delegates work by creating a delegation record that defines the scope of the authority being transferred. This record specifies:

- the delegating agent (delegator)
- the receiving subagent (delegate)
- the actions the subagent may perform
- the resources it may access
- the conditions under which the delegation is valid, including an expiration

A simplified delegation record might look like this:

```
delegation_id: "d-1027"
delegator: Agent::"acme_assist"
delegate: Agent::"research_agent"
delegatedActions: [
  Action::"documents.search",
  Action::"documents.read",
  Action::"documents.summarize"
]
resourceScope: CustomerDocs::"CustCo"
expires: "2026-03-31T18:00Z"
```

This record does not grant authority on its own. Instead, it provides additional context that the policy system evaluates at runtime. This
