```
permit (
    principal,
    action,
    resource
)
when {
    action in context.delegation.delegatedActions
    && resource in context.delegation.resourceScope
    && context.currentTime < context.delegation.expires
};
```

These policies ensure that:

- the subagent can perform only the actions explicitly delegated
- the subagent can access only the specified resources
- the delegation is valid only within its defined time window

If any of these conditions are not satisfied, the request is denied.

18.6.4 Allowed and denied behavior

This model makes delegation behavior explicit and verifiable.

- If a subagent performs an action within the delegated scope—for example, reading documents for the specified customer—the policy engine issues a permit decision, and the action proceeds.
- If the subagent attempts to exceed its authority—for example, by accessing documents for another customer or performing an unapproved action—the policy engine returns a deny decision. The action is blocked, and the agent must revise its plan.

Because the delegation constraints are included in every authorization request, the policy decision reflects both the subagent's identity and the limits of the authority it was granted.
