This policy ensures that payments are only issued when the request complies with the delegation limits: the reimbursement amount must stay below the authorized threshold, a receipt must be provided, and the delegation must still be valid.

Because the partner’s agent is constrained by policy, it can make structured promises about how it will behave. These promises describe how the agent will act if authority is delegated to it. For example, the partner’s payment agent might offer a promise derived from its policy configuration:

```
{
  "agent": "did:web:agents.partnerpay.example:reimbursement-agent",
  "promise": {
    "action": "contractor.reimbursement.pay",
    "constraints": {
      "max_amount": 250,
      "currency": "USD",
      "requires_receipt": true,
      "purpose": "process contractor reimbursements"
    },
    "audit": "signed payment receipt returned",
    "policy_framework": "cedar"
  }
}
```

A promise does not grant authority; instead, it communicates how the receiving agent’s internal policies constrain its actions when authority is delegated. Figure 18.6 shows the resulting interaction pattern. The partner’s agent first presents its promise. ACME’s reimbursement agent assesses the promise using its local policies and the information stored in its reputation database, then decides whether to delegate authority to the partner’s agent.
