cultural expectations of reciprocity can influence how ratings are managed. When drivers are expected to prove their identity attributes but riders are not, drivers may think the platform is unfair. Using real names is another example. Pseudonyms like `XX_RIDER23` may inspire less trust by drivers in the rider. Failure to account for these norms may lead to a system being untrusted even as it provides technical confidence that it is operating correctly.

Governance is how rules are made. Governance might include informal policies, a formal rulebook, government regulations, or even laws. At an organizational level, governance determines policies and manages tradeoffs with cost, fairness, security, compliance, operational efficiency, and user experience. As we saw in the discussion on identity models in section 2.5, governance also plays a role in cross-organization identity transactions, determining important considerations like who is responsible for authentication, how attributes can be used, and where liability lies. We will deal with governance in detail in chapter 18.

Table 2.2 A comparison of technical confidence and trust

Aspect	Technical Confidence	Trust
Foundation	Cryptography, software, authentication, policies	Governance, oversight, social norms
Scope	Ensures identity validity and policy enforcement	Ensures policies are fair, accountable, and correct
Strengths	Objective, measurable, scalable—identity verification and enforcement can be automated with high reliability	Flexible, adaptable, and responsive to human concerns —allows for policy exceptions, ethical oversight, and judgment
Weaknesses	Can be circumvented by insider threats, weak policies, or social engineering	Can be subjective, slow, and prone to human error

Table 2.2 compares the scope, strengths, and weaknesses of technical confidence and trust. Reading the table should convince you that confidence and trust both play a role in creating an effective identity system. Where technology provides confidence through evidence and assurance, governance gives us the ability to mitigate risk and instill trust.
