```
aws verifiedpermissions create-policy \
  --policy-store-id $STORE_ID \
  --definition file://policy-customer-view.json
```

This returns a JSON object that provides its policy ID, type (`STATIC` in this case), actions, effect, and timestamps for creation and last update.

EMPLOYEES

The following policy permits employees to view a document if they are on the employee readers team for it or if they are the manager of the owner:

```
permit(
  principal is ACME::Employee,
  action == ACME::Action::"doc:view",
  resource is ACME::Document
)
when {
  principal in resource.employee_readers_team
  || resource.owner.manager == principal
};
```

We can apply the same formatting we did to the policy for customers viewing documents and then upload it to the policy store:

```
jq -Rs --arg desc "Employee view policy" \
   '{static: {description: $desc, statement: .}}' \
   policy-employee-view.cedar > policy-employee-view.json

aws verifiedpermissions create-policy \
  --policy-store-id $STORE_ID \
  --definition file://policy-employee-view.json
```

Like before, you should get back a JSON message confirming that the policy has been successfully added to the policy store and providing the relevant information about it.
